

# User Guide

## U-Value Calculator

Version 1.4.5

## Installation

1. The CD starts the installation automatically. Execute the file **autoStartSetup.exe** if Auto Run is disabled
2. Select the language
3. Press the button **Installation**
4. Choose the installation folder
5. An icon called **Forster U-Value Calculator** is created automatically on the desktop
6. The **Product activation** window will appear while starting the software
7. If you have a serial number, enter this in the appropriate field and press OK
8. If you do not have a serial number, click the link **Apply for serial no.**
9. The **Application form** window will appear
10. Fill in all the fields marked with an asterisk
11. If you have an Internet connection, press the **Transmit** button  
The application is transmitted automatically  
You will then receive confirmation of receipt immediately
12. If you do not have an Internet connection, click the **Print** button  
You can send this application by fax or mail
13. You will then receive a serial number by e-mail, fax or mail depending on the option you have chosen  
You then need to enter this in the **Product activation** window

## Contents

This programme provides you with a graphic interface and database to help you calculate the total U-value of selected elements made up of thermally insulated Forster profiles.

## Update

We will inform you in writing if a new update is available. The Update function can be found in the task bar under **Help**.

## Help

The Help function is located in the task bar under **Help**. You can also click the Help button. This file explains all the functions and how to use this software. For further questions, please contact our Helpline on **+41 71 447 43 36**.

## System requirements

### Software

- Windows XP
- Windows Vista
- Windows 7
- .NET 4.0 Client (included)

### Hardware

- Pentium, 1 GHz
- 512 MB RAM
- 600 MB free hard disk space
- 1024 x 768 resolution
- CD ROM drive

## The project data is included in the “Project description” register

This offers the facility to selectively describe and separately calculate even complex building units. Likewise, additional data on the project and/or element to be calculated can be entered in the **comments** window. This simplifies the summary of calculations.

All dimensions in millimetres

**U-value**

Glazing/panel selection: **insulated glass 1.1** U-value: 1.1 W/(mK)

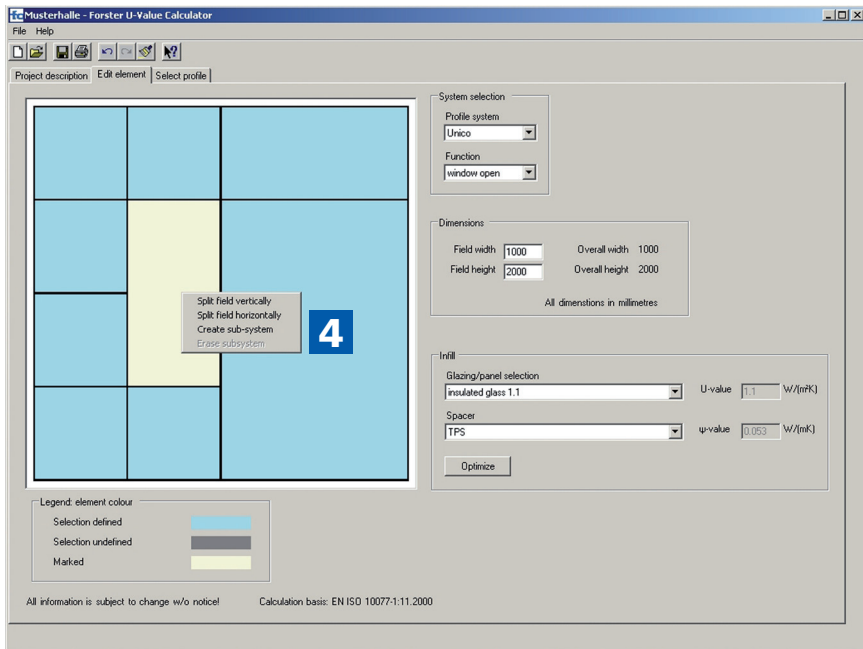

Spacer: **TPS**  $\psi$ -value: 0.053 W/(mK)

Optimize

All information is subject to change w/o notice! Calculation basis: EN ISO 10077-1:11:2000

## The elements to be calculated are specified in the “Edit element” register

- 1) The **Profile system** and **Function** are chosen from **System selection**. Established or evident functions of the selected system are picked from **Function**, e.g. a window sash in Forster unico.
- 2) The dimension units can be modified or changed simply and quickly under **Dimensions**.
- 3) The filling types and boundary frame systems can be selected from **Infill**. This database contains all commonly used insulating glass, panel filling and spacers. If a required glass type or spacers are not available in this selection, the relevant value can be determined via a free entry.

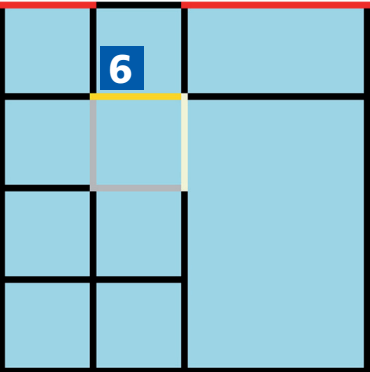

- 4) Right-clicking brings up several selection terms. One selection option is to split or change the fields, both horizontally and vertically. When a field is selected, it is also possible to add a subsystem, e.g. a window or door or delete an existing subsystem.

Résultat

Name	Value
76.852 (W/A)	2.48 W/(m²K)
76.852 / 531.732 / 530.	3.13 W/(m²K)
76.851 / 531.732 / 530.	3.09 W/(m²K)

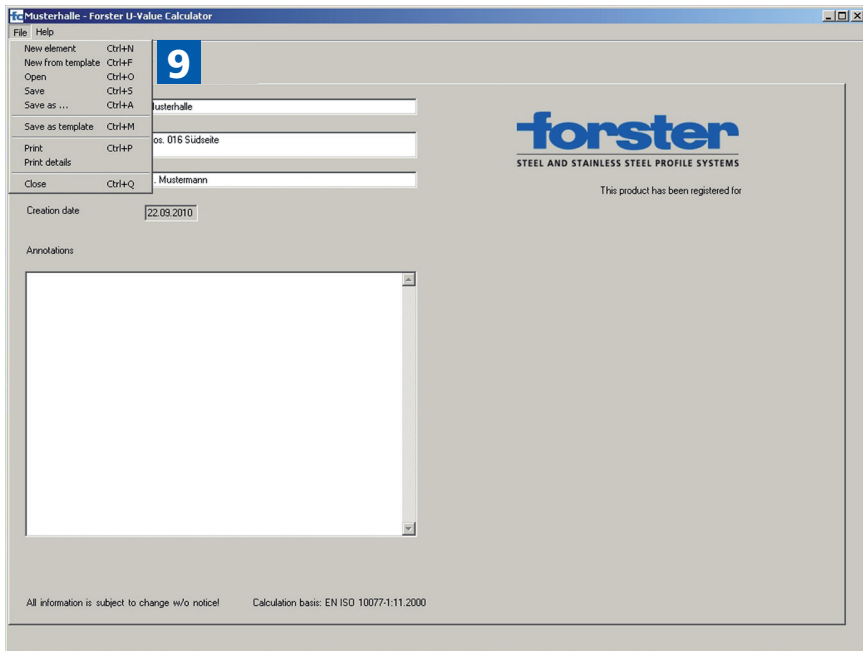

Valeur U totale  W/(m²K)

## The elements to be calculated are specified in the “Select profile” register

- 5) The required material quality (steel, stainless steel or combination) is picked from the **Material** selection window. In the **Profile selection**, the profile or the profile combination for usage elements can be specified. The schematic of the profile located in the selection also appears next to the profile number. When the **Selected profile** is clicked, its colour changes from black to red. The profiles which are already specified and those which are still to be selected are identified in this way.
- 6) The same selection principle also applies for specifying the profile for the subsystem. During profile selection, all profiles used in this combination are displayed here. In the case of the subsystem, the profile already selected is marked in yellow. This identifies immediately where a moving element is located within the frame to be calculated.
- 7) The **Result** window shows all  $U_f$ -values of individual profiles and profile combinations that are already specified and selected in the element. These windows are used for additional information and checking purposes.

- 8) Once all profiles in the element are selected and specified, the entire U-value of the element appears in the **Total U-value** window. The result of this calculation can be printed in one of two ways.

- 9) Left-clicking on **File** brings up different memory functions. **Save** and **Save As** saves the file. The default path is the **masterElements** folder. The **Save as template** function enables a personal library to be created with template types. These template types can be viewed and opened in **New from template**.

- 10) Left-clicking on **Help** brings up the **Updates** function selection. All updates are displayed under **Available**. The **Add** and **Remove** buttons can be used to select updates. This function is used to update both program and data from the database.

## U-value calculation

### Project description

Object name Musterhalle  
 Item Pos. 016 Südseite  
 Person in charge H. Mustermann  
 Creation date 22.09.2010

### Project description

Width 4000 mm  
 Height 4000 mm

### Component overview

	U-frame Ø / $\psi$ Ø	Area / length	Percent of area
Profiles	2.296 W/(m <sup>2</sup> K)	1.75 m <sup>2</sup>	11 %
Infills (glazing/panel)	0.6 W/(m <sup>2</sup> K)	14.25 m <sup>2</sup>	89 %
Spacers	0.08 W/(mK)	50.79 m	

### Resultant heat transfer

Calculation basis: EN ISO 10077-1:11.2000

U-total 1.1 W/(m<sup>2</sup>K)

### Annotations

Please note:

This preliminary thermal calculation is based on tested and calculated profiles. Legal claims cannot be derived from using the calculation. The contractor in charge has to check any data determined for correctness, or have them checked by an approved building physics expert.

Once the values have been calculated, the file can be printed on one page. As well as a diagram, all key data for the calculated element are displayed here. Besides the calculated overall U-value, the project description (data on project and element), the overview of the components ( $U_i$ -value for the frame, filling and spacers, data on area and profile length) of the element is also displayed here.

As well as this “simple” output, each individual field of the element can be output on a separate page. This enables individual fields to be analysed and evaluated.
